

IDEATION PHASE

BRAINSTORMING – IDEA GENERATION & PRIORITIZATION

Date	3rd October 2026
Team ID	6ab8c0aa8c7c66e70673078c
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	

2.3 BRAINSTORMING – IDEA GENERATION & PRIORITIZATION

The brainstorming process was carried out to identify possible approaches for solving the record-access problem in ServiceNow.

A. Idea Generation

No.	Idea	Description
1	Role-Based Access Control	Use custom roles to determine the operations a user can perform.
2	Field-Based Restriction	Use the Branch field to restrict access to specific records.
3	Script-Controlled ACL	Use ACL scripting to evaluate access conditions before granting access.
4	Separate CRUD ACLs	Create separate ACLs for Read, Create, Write, and Delete operations.
5	Test User	Create a dedicated test user to verify the access-control configuration.
6	Multiple Branch Records	Create ECE, EEE, and CSE records to test field-based restrictions.
7	Progressive Role Assignment	Use bb1, bb2, bb3, and bb4 to demonstrate increasing permissions.
8	Administrator Verification	Use administrator access to verify the configured security behavior.

B. Idea Evaluation and Prioritization

The generated ideas were evaluated according to their relevance to the project requirements.

Idea	Priority	Reason
Role-Based Access Control	High	Required to control user permissions.
Field-Based Restriction	High	Required to restrict records according to Branch.
Script-Controlled ACL	High	Core mechanism of the project.
Separate CRUD ACLs	High	Required to control individual operations.
Test User	High	Required for access verification.
Multiple Branch Records	High	Required to test the Branch condition.
Progressive Role Assignment	High	Demonstrates different permission levels.
Administrator Verification	Medium	Used to verify and manage the configuration.

C. Selected Solution

After brainstorming, the team selected a combination of the most relevant ideas:

Custom Roles + Script-Controlled ACLs + Branch-Based Restriction + Separate CRUD Permissions

The selected approach can be represented as:

Role-Based Concept

Role	Permitted Operation
bb1	READ
bb2	CREATE
bb3	WRITE
bb4	DELETE

For the Read requirement:

D. Brainstorming Outcome

The brainstorming process resulted in the following project concept:

To implement a ServiceNow-based record-level security mechanism using custom roles and Script-Controlled ACLs, where the user's assigned roles determine the permitted operations and the Branch field is used to restrict record visibility.

The selected solution provides the foundation for the Requirement Analysis Phase, where the customer journey, solution requirements, data flow, user stories, and technology stack are defined.
