

IDEATION PHASE

EMPATHY MAP CANVAS

Date	3rd October 2026
Team ID	6ab8c0aa8c7c66e70673078c
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	

2.2 EMPATHY MAP CANVAS

The empathy map considers the perspective of the ServiceNow administrator/security administrator, who is responsible for managing users, roles, records, and access permissions.

SAY

What does the administrator say?

- “Users should access only the records they are authorized to view.”
- “Different users should have different permissions.”
- “EEE records should be accessible only according to the defined access rules.”
- “Users should not be able to modify or delete records without permission.”
- “The ACL configuration should be tested before deployment.”
- “Access rules should be clearly defined and manageable.”

THINK

What does the administrator think?

- How can access be restricted based on the Branch field?
- Which role should be associated with each operation?
- How can Read, Create, Write, and Delete permissions be controlled separately?
- Will the ACL correctly restrict unauthorized users?
- What happens when a user has multiple roles?
- How can the configured access rules be verified?

DO

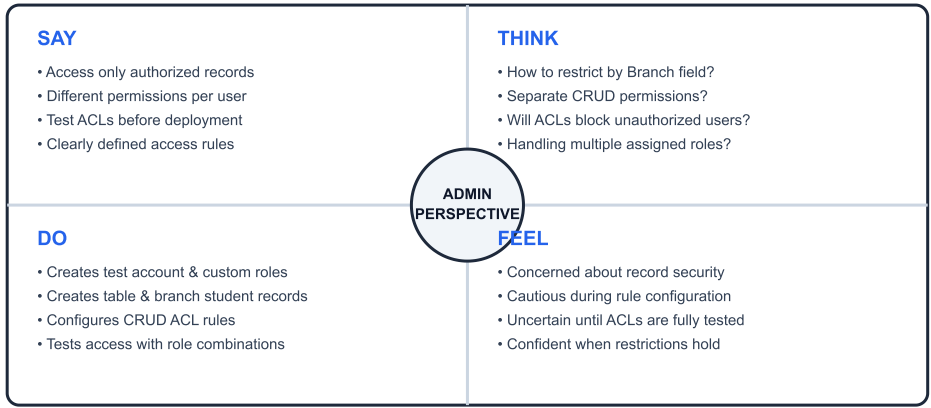

What does the administrator do?

- Creates the EEE User test account.
- Creates the custom roles bb1, bb2, bb3, and bb4.
- Assigns the required roles to the user.
- Creates the Institution Details table.
- Creates student records with ECE, EEE, and CSE branch values.
- Configures ACLs for Read, Create, Write, and Delete.
- Tests the ACLs using different users and role combinations.
- Verifies authorized and unauthorized access.

FEEL

What does the administrator feel?

- Concerned about unauthorized access to student information.
- Responsible for maintaining record security.
- Cautious while configuring permissions.
- Uncertain until the ACL rules are tested.
- Confident when the configured rules behave as expected.
- Satisfied when users receive only their intended permissions.

EMPATHY MAP SUMMARY

Empathy Area	Key Observation
Says	Users should access only authorized records and operations.
Thinks	Roles and field values must be evaluated to control access.
Does	Creates users, roles, tables, ACLs, and performs testing.
Feels	Responsible for security and concerned about unauthorized access.

USER NEEDS IDENTIFIED

From the empathy map, the following needs were identified:

- Secure access to student records.
- Role-based permissions.
- Branch-based record restriction.
- Separate CRUD permissions.
- Prevention of unauthorized operations.
- Easy verification of access rules.
- Manageable security configuration.
