Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	

6. PROJECT DEVELOPMENT PHASE

The Project Development Phase describes the implementation and validation of the Script-Controlled ACL – Restrict Record Access Based on Field Value project in the ServiceNow environment.

As shown in the project structure, this phase consists of two major activities:

6.1 Performance Testing

6.2 User Acceptance Testing

The testing is carried out after implementing the users, roles, Institution Details table, and ACLs for Read, Create, Write, and Delete operations.

6.1 PERFORMANCE TESTING

Performance testing is conducted to verify that the implemented ACL configuration responds correctly when users attempt to access or perform operations on records in the Institution Details (u_institution_details) table.

The primary focus of this project is to verify the consistent execution of access-control rules, rather than measuring numerical application response time.

OBJECTIVES

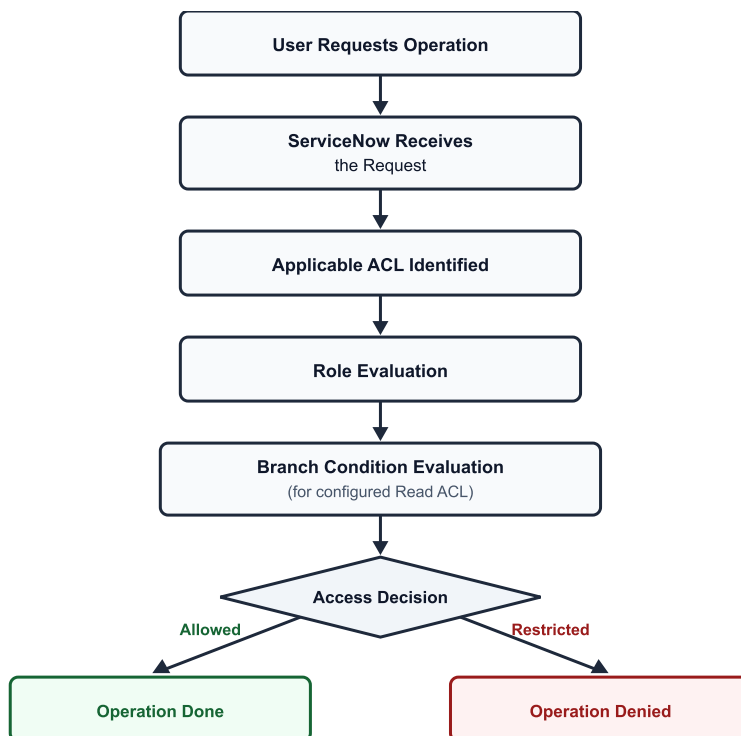

The performance testing aims to:

- Verify that the appropriate ACL is evaluated for each requested operation.
- Verify that user roles are correctly evaluated.
- Verify that the Branch = EEE condition is applied for the configured Read restriction.
- Verify that authorized operations are permitted.
- Verify that unauthorized operations are restricted.
- Verify the behavior of different role combinations.

PERFORMANCE TEST CASES

Test ID	Test Condition	Operation	Expected Result
PT01	User has bb1 role	Read	Permitted EEE records are accessible
PT02	User does not have required Read permission	Read	Access is restricted
PT03	User has bb1 + bb2	Create	User can create a record
PT04	User has bb1 + bb2 + bb3	Write	User can edit permitted records
PT05	User has bb1 + bb2 + bb3 + bb4	Delete	User can delete permitted records
			Corresponding operation is

PERFORMANCE TESTING FLOW

PERFORMANCE TESTING OUTCOME

The testing verifies that the configured ACLs are consistently evaluated during record operations. The system applies the defined roles and conditions before granting the requested access.

Note: No numerical response-time values are included because the project description does not specify measured response-time benchmarks. Actual measured values should only be added if they were recorded during testing.
