

Project Design Phase-II

Customer Journey Map

Date	3rd October 2026
Team ID	6ab8c0aa8c7c66e70673078c
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	

3. REQUIREMENT ANALYSIS

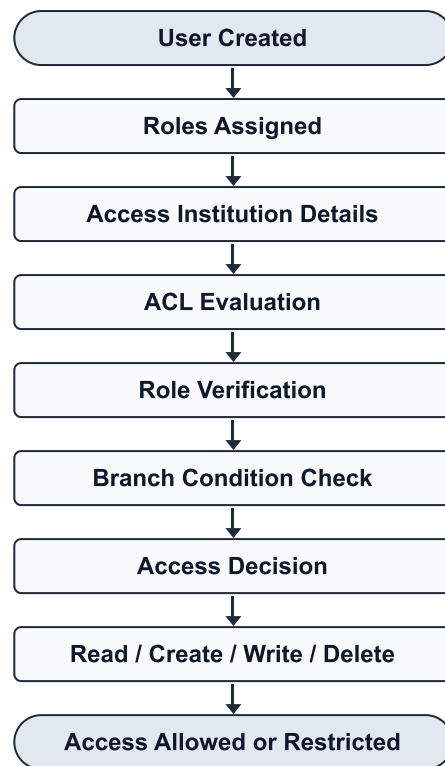

3.1 CUSTOMER JOURNEY MAP

The customer journey map describes the interaction of the ServiceNow user with the system, beginning with user access and continuing through the different record operations. In this project, the journey focuses on how the user's assigned roles and the record's Branch value influence the access provided by the ACLs.

CUSTOMER JOURNEY

Stage	User Action	System Interaction	Expected Outcome
1. User Creation	Administrator creates EEE User	ServiceNow creates the user account	Test user is available
2. Role Assignment	Administrator assigns bb1–bb4 roles	Roles are associated with the user	User receives defined permissions
3. Table Access	User opens Institution Details	ServiceNow checks applicable ACLs	Access is evaluated
4. Record Viewing	User attempts to view student records	READ ACL checks role and Branch condition	Authorized EEE records are displayed
5. Record Creation	User selects New	CREATE ACL checks bb2 role	Authorized user can create a record
6. Record Editing	User attempts to modify a record	WRITE ACL checks bb3 role	Authorized user can edit
7. Record Deletion	User attempts to delete a record	DELETE ACL checks bb4 role	Authorized user can delete
8. Verification	Administrator tests different users/roles	ACLs evaluate each request	Unauthorized operations are restricted

USER JOURNEY FLOW

JOURNEY OUTCOME

The customer journey demonstrates that access is not granted solely because a user can access the ServiceNow instance. The configured ACLs evaluate the user's authorization and, for the Read requirement, the Branch value before allowing access to the relevant records.
